Isthmus of Corinth

About

The Isthmus of Corinth is a narrow strip of land that connects mainland Greece with the Peloponnese, while the canal that has been opened in it connects the Saronic Gulf with the Gulf of Corinth. It is about 6 kilometres long and the narrowest point is where the Corinth Canal was constructed (1882-1893). It was a strategic point and for this reason, a wall had already been built in ancient times (late 5th century BC), which had been preserved until the Byzantines (Hexamilion). The Isthmus of Corinth was known in the ancient world as the landmark that separated the Peloponnese from the rest of mainland Greece. In the 1st century AD, geographer Strabo pointed out a column on the Isthmus of Corinth that bore two inscriptions. One towards the east, i.e. Megara of Attica, which said: “This is not Peloponnese, but Ionia” and the other towards the west, i.e. the Peloponnese: “This is Peloponnese, not Ionia”. Plutarch attributed the erection of this column to the hero of Attica, Theseus, on his way to Athens. From 1893, a 6.3 kilometre-long isthmus canal, the Corinth Canal, has been open, which practically makes the Peloponnese an island. Today, two road bridges, two railway bridges, and two submersible bridges at the two ends of the canal connect the mainland side of the isthmus with that of the Peloponnese. There is also a military emergency bridge at the western end of the canal. The idea of a shortcut so that sailing vessels do not sail around the Peloponnese had been examined for a long time by the ancient Greeks. The first attempt to open a canal there was made by the tyrant Periander in the 7th century BC. He abandoned the project due to technical difficulties and instead built a simpler and less expensive land stone ramp, called Diolkos, as a passage road. Remains of the Diolkos still exist today next to the modern canal. When the Romans gained control of Greece, several different solutions were attempted. Julius Caesar foresaw the benefits of a connection for the newly founded Corinth as Colonia Laus Iulia Corinthiensis. During the reign of Tiberius, engineers attempted to dig a canal but failed due to a lack of modern equipment. Instead they maintained and used the Diolkos: a paved trackway along the isthmus, on which ships were hauled on wheeled cradles. In 67 AD, the Philhellenic Roman emperor Nero ordered 6,000 slaves to dig a canal with shovels. The historian Josephus Flavius wrote that the 6,000 slaves

were Jewish pirates who were captured by Vespasian during the Jewish Wars. According to Pliny the Elder the work advanced four stades (about 700 metres). Nero died the following year and his successor Galba abandoned the project as too costly. The idea was first seriously proposed in the modern era in 1830, immediately after Greece's liberation from the Ottoman Empire, and was completed in 1893 after eleven years of work.

Distances & what is nearby

Straight-line distances, for a quick sense of scale — use the navigation QR for the real driving route.

How far it is

Loutraki	**3.7 km**
Corinth	**4.6 km**
Kiato	**22 km**
Nemea	**31 km**
Xylokastro	**34 km**
Athens	**65 km**

Close by

Corinth Canal	**1.2 km**
Statue of Nero, Isthmus	**1.4 km**
Roman Villa	**1.6 km**
Diolkos	**2.0 km**
Asprochomata	**2.1 km**
Ancient Diolkos	**2.1 km**
Isthmus Submersible Bridge	**2.2 km**
Hexamilion Wall	**2.3 km**

Useful information

Best time to visit	April–June & September–October (mild, uncrowded)
